

- OPENCLAW COURSE · EXTRA CLASS A
- Updated for v2026.3.2 · gog CLI + Native PDF

Integrations

of Tools

ClawHub Skills, gog CLI for Google Workspace,
Direct APIs, native PDF and how to document everything
in TOOLS.md.

DURATION

20-25 min

LEVEL

Beginner

VERSION

v2026.3.2

EXTRA A · INTEGRATIONS

openclaw.ai/curso

01 Why Integrate?

Without integrations, the agent is blind. With integrations, it sees everything.

- The game changer

This class is where your agent goes from chatbot to an assistant that actually works

- An agent connected to your tools eliminates hours of manual work every week.

- Without Integration

Isolated agent, only answers questions, doesn't have access to your real data

- With Integration

Connected agent: sees your appointments, creates tasks, analyzes metrics, manages files

02 ClawHub Skills

The easiest way · install as an app

- ClawHub = Skill App Store

Someone has already done the heavy lifting. You just install and use. Without configuring anything manually.

Search for available skills

1

clawhub search notion

clawhub search google

clawhub search github

BASH

Install a skill

2

Install the Notion skill

clawhub install notion

BASH

· Recommended Skills to Get Started

SKILL

WHAT IT DOES

PRIORITY

notion

Project management, databases, CRM

· High

1password

Secure credentials (required)

· High

github

PRs, issues, CI/CD

· Medium

weather

Weather · good for testing

· Low

The skill is automatically registered in OpenClaw · the agent already knows how to use it.

View installed skills

clawhub list

Test the skill

Send to the agent:

· "List the tasks from database [ID] that are in 'In Progress' status"

2

EXTRA A · INTEGRATIONS

openclaw.ai/curso

03 gog CLI

NEW 3.2

Google Workspace simply · without creating a project in Google Cloud

· Why not use the manual OAuth flow?

The manual OAuth flow for Google requires creating a project in the Google Cloud Console, configuring OAuth credentials, enabling APIs... It's complicated and breaks easily. The

gog CLI

eliminates all of that.

Install gog CLI

1

`npm install -g gog`

BASH

Authenticate (one command for everything)

A browser window will open. Authorize with your Google account. Ready · all services are authenticated.

2

Authenticates Calendar, Drive, Gmail and Docs at once

`gog auth login`

BASH

Use the services

3

Google Calendar

`gog calendar list --account=YOUR_EMAIL`

`gog calendar create --title="Meeting" --start="2026-03-10T14:00"`

Google Drive

`gog drive ls --account=YOUR_EMAIL`

`gog drive upload /path/file.pdf --parent ID_FOLDER`

Gmail

`gog gmail inbox --limit 10 --account=YOUR_EMAIL`

`gog gmail send --to=fulano@email.com --subject="Hi"`

BASH

·Tip: use environment variable

Configure GOG_ACCOUNT=your@email.com in the environment so you don't have to pass --account in every command.

04 Native PDF Tool

NEW 3.2

Without installing anything · it already works

·Zero configuration required

From version 3.2 onwards, your agent analyzes PDFs directly. No skill, no extra configuration.

MODEL

SUPPORT

HOW IT WORKS

Anthropic Claude

· Native

Direct PDF analysis

Google Gemini

· Native

Direct PDF analysis

Other models

·· Fallback

Text/image extraction

Practical use cases

Analyze invoices and receipts · extract data for Notion

Automatically summarize long reports

Review contracts and identify critical points

Extract data from spreadsheets in PDF

Up to 10 PDFs per message

Google Docs (reading)

gog docs get ID_DO_DOC --account=YOUR_EMAIL

The agent simply handles PDFs:

"Analyze this contract: /documents/contract.pdf"

"Extract the data from this invoice: /nf/nota-123.pdf"

"Summarize this 50-page report"

EXTRA A · INTEGRATIONS

openclaw.ai/curso

05 Direct APIs

When there's no ready-made skill · the step-by-step

Any tool that has an API can be integrated. Follow the flow:

Get the API Key

Access the tool's panel · Developers / API · create a key.

·NEVER hardcode the API Key

Don't put the key directly in the code, config.json, or any file.

Use 1Password.

1

Save in 1Password

Or add manually via the 1Password app/web.

2

Via CLI (if you have op installed)

```
op item create --category=api-credential \
```

```
--title="Stripe Produção" \
```

```
--vault="Amora Vault" \
```

```
secret_key="sk_live_..."
```

BASH

Agent retrieves the credential when needed

3

The agent does this behind the scenes:

```
STRIPE_KEY=$(op item get "Stripe Produção" \
```

```
--vault "Amora Vault" --field secret_key --reveal)
```

```
curl https://api.stripe.com/v1/balance \
```

```
-u "$STRIPE_KEY:"
```

BASH

Document in TOOLS.md

4

06 Customized Skill

For niche tools · a folder with instructions

· You don't need to program

The SKILL.md is plain text. Copy the API documentation of the tool, explain how the agent should use it, and you're done. The agent does the rest.

Stripe (Payments)

- **1Password Item:** `Stripe Production`
- **Vault:** Amora Vault
- **Access:** Read free, Write = mandatory approval

MARKDOWN

Create the skill folder

`mkdir -p ~/.openclaw/skills/crm-empresa-x`

Create the SKILL.md (only text, no code!)

The agent reads and follows the instructions

Register

`openclaw skills register ~/.openclaw/skills/crm-empresa-x`

Verify

`openclaw skills list`

BASH

EXTRA A · INTEGRATIONS

openclaw.ai/curso

07 Decision Flow

How to integrate any tool · 5 questions

· Decision Tree

1. Does the tool have an API? (search for "API documentation" on Google)

2. Is there a skill on ClawHub? · clawhub search name

3. If yes · clawhub install name · test

4. If no · get API key · save in 1Password · document in TOOLS.md

5. If you're going to use it frequently · create a custom skill

· Security Rules · Inviolable

NEVER put API keys directly in the code or config files

NEVER commit credentials to Git

ALWAYS use 1Password (or equivalent manager)

ALWAYS define permissions (read-only when possible)

ALWAYS document in TOOLS.md what the agent can and cannot do

· Checkpoint of Extra Class A

Knows how to search for and install ClawHub skills

gog CLI installed and authenticated (if using Google Workspace)

At least 1 Google service working via gog

Native PDF tool tested with a real document

Knows how to integrate API directly (1Password + curl + documentation)

All credentials in 1Password (zero hardcoded)

Secrets audit (never leave keys exposed)

openclaw secrets audit

If you find something · migrate to the secure vault

openclaw secrets apply

BASH

Integrations documented in TOOLS.md

openclaw secrets audit

returning clean

- Common Troubleshooting
- "clawhub: command not found"

npm install -g clawhub

- "Skill installed but agent doesn't know how to use it"

openclaw skills list · if it doesn't appear: openclaw skills register

~/.openclaw/skills/name · openclaw gateway restart

- "API returns 401 Unauthorized"

Verify if the API key is correct, if it hasn't expired, and if it has sufficient permissions. Generate a new key if necessary.

- "gog: authentication failed"

Run gog auth login again. If it persists, verify GOG_KEYRING_PASSWORD configured in the environment.
