March 2026 Fix

In the foundation class, memory_search crashed asking for OpenAI API key.

This bug was fixed.

Today it works natively · without needing an external embedding key.

01 · THE PROBLEM

Why your agent has digital Alzheimer's

Every time you open a new session with your agent, it wakes up from scratch. Without memory of what you talked about yesterday, the decisions you made, the projects you are working on.

..

Real problem

Without a memory structure, you repeat context every day. It's like hiring a brilliant assistant who wakes up with amnesia every morning.

The solution is to teach the agent to persist what matters in files · and search for these files in an intelligent way when needed.

02 · HOW IT WORKS

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

2/9

The 4-Layer Memory Architecture

1

Session Context

TEMPORARY

The current conversation. Everything you and the agent exchanged. Cleared on /new.

2

Daily Notes

PERSISTENT

memory/sessions/2026-03-14.md · raw log of what happened today. Automatically reloaded in the next session.

3

Topic files

PERSISTENT

Decisions, lessons, projects, people, pending. Searched on demand via memory_search.

4

MEMORY.md · general index

ALWAYS LOADED

Loaded in every main session. It's the map · not the territory. Points to where each thing is.

.

What the agent loads automatically

Only: SOUL.md, USER.md, AGENTS.md, MEMORY.md and today's + yesterday's notes. The topic files are outside the context · the agent searches only what it needs, when it needs it.

03 · SEMANTIC SEARCH

How the agent finds anything

The agent uses semantic search · it's not a keyword search. It understands the meaning of what you ask and finds the relevant snippet in the files.

How it works in practice

When you ask for something, the agent uses two internal tools:

TOOL

WHAT IT DOES

memory_search

Semantic search

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

3/9

Finds the most relevant chunks in all files (~400 tokens per chunk)

memory_get

Precise reading

Reads only the specific lines of the found file. Economical in tokens.

This means that when you ask "what was decided about APIs?", it doesn't need to open the entire file · it searches for and brings only the right excerpt.

·

March 2026 Update

The memory_search now works natively without needing an external API key (OpenAI/Gemini). The bug that appeared in the previous class has been fixed.

Real search examples

WHAT YOU SAY · WHICH FILE THE AGENT SEARCHES IN

"what is the status of Metricaas today?"

· memory/projects/metricaas.md

"what is the tone of voice of my LinkedIn?"

· memory/content/voice/linkedin.md

"what are the credential rules?"

· memory/context/decisions.md

"is there any analytics skill available?"

· skills/analytics/

"what is the Telegram group ID for MGM?"

· memory/integrations/telegram-map.md

"what is Tiago pending?"

· memory/context/people.md + memory/context/decisions.md

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

4/9

04 · ORGANIZATION

Recommended folder structure

Well-organized folder = better search. If you throw everything into a giant file, the agent will bring the wrong context. Below is the actual structure I use in my agent · you can adapt to your business.

.

Why subfolders matter

ACTUAL STRUCTURE OF THE AMORA WORKSPACE (MY AGENT)

memory/

... MEMORY.md · general index (always loaded)

.

... context/ · everything that doesn't change quickly

· ... decisions.md · permanent rules of the agent

· ... lessons.md · errors and learnings

· ... people.md · team, suppliers, partners

· ... business-context.md · business context

.

... projects/ · one file per active project

· ... metricaas.md · Metrics SaaS (with Tiago)

· ... mgm.md · MyGroupMetrics

· ... comunidade-ai.md · AI Community (launch 05/04)

· ... mission-control-apis.md

.

... content/ · specific to content production

· ... voice/linkedin.md · voice tone guide per platform

· ... voice/youtube.md

· ... ideas.md · content ideas

· ... drafts/ · drafts of newsletters, posts

.

... integrations/ · map of tools and accesses

· ... telegram-map.md · IDs of groups and topics

· ... credentials-map.md · where each credential is

.

... sessions/ · diary (one file per day/theme)

... 2026-03-14.md · today

... 2026-03-12-mission-control-v3.md

... 2026-03-08-startup-summit.md

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

5/9

When you say "what's the status of Metricaas?", the agent searches in memory/projects/ and finds exactly the right file. If everything was in a giant projects.md, it would bring context from other projects along with it · polluting the answer.

..

Golden rule

MEMORY.md is the map, not the territory. It points to where each thing is · it doesn't duplicate the content. If you duplicate, the agent gets confused.

What goes in each place · with real examples

FILE

WHAT IT STORES

context/decisions.md

Irreversible decisions

"All credentials are in 1Password" · "Deploy only after approval" · The agent never breaks these rules.

context/lessons.md

Mistakes and learnings

Strategic = permanent. Tactical = expires in 30 days. Ex:

"Don't call API X without cache · it's expensive".

context/people.md

Team and partners

How to interact with each person · tone, context, what they do. The agent learns to treat each one differently.

projects/name.md

Individual status

One file per project. Ex: metricaas.md has current MRR, next features, pending issues with Tiago.

content/voice/platform.md

Tone of voice per channel

Before creating any post, the agent reads this file. Guarantees consistency of style on LinkedIn, YouTube, newsletter.

sessions/YYYY-MM-DD.md

Day log

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

6/9

FILE

WHAT IT STORES

Raw, uncurated. Can have multiple files per day
separated by theme: 2026-03-12-mission-control.md

05 · HOW TO ASK TO SAVE

Teaching your agent to remember what matters

.

The biggest mistake beginners make

Trusting that the agent will remember without explicitly asking. If it's not in a file, it doesn't exist in the next session.

· DOESN'T WORK

"Remember this"

"Save this for me"

"Don't forget that..."

· WORKS

"Save in memory/decisions.md"

"Record in memory/pending.md"

"Add to memory/lessons.md"

Quick criteria for knowing where to save

· decisions.md

"Every password goes to 1Password"

"Deploy only after testing"

Things that cannot change.

· lessons.md

"Never do X without Y"

"I learned that this approach breaks
when..."

Mistakes that cannot be repeated.

· pending.md

"I need to approve João's proposal"

"Review the product onboarding"

· projects/name.md

"Launch in May, payment integration is
missing"

3/14/26, 7:39 PM

Module 4 · Agent Memory | OpenClaw

file:///root/.openclaw/workspace-amora-cos/reports/misc/template-material-aula-memoria.html

7/9

Things waiting for you.

Current status of each separate project.

PRACTICAL EXERCISE

· Activating your agent's memory

Do it right now · it takes less than 10 minutes

1

Copy the prompt below and paste it into your agent

Attach the module files together (memory-architecture.md and the templates).

Read the memory architecture PRD and create:

1. memory/ folder structure with the topic files
2. MEMORY.md as an index (do not duplicate content)
3. Inviolable rule in AGENTS.md: before compressing, extract lessons, decisions, and pending items
4. Automatic daily notes in memory/sessions/

2

Test the semantic search

After creating the files, close the session and open a new one. Ask:

"What are my permanent decisions?"

"What is pending?"

The agent must search for and bring the information without you giving context.

3

Save something important and test it in the next session

Make a real decision now and ask to save:

"I decided that [your decision here].

Save this in memory/decisions.md as

permanent decision."

3/14/26, 7:39 PM

8/9

SUMMARY

What you learned

The 5 key concepts of this module

4-layer architecture

Context · Sessions · Topics · MEMORY.md.

Each layer has its role.

Selective loading

The agent only loads what's essential. Topic files stay out · they are searched on demand.

Semantic search

memory_search finds by meaning, not by word. Separating files by topic improves the search.

Explicitly ask

The agent doesn't save on its own. You need to say: "save in memory/decisions.md".

Folder structure

projects/ separated by project. sessions/ by day. context/ for people and business.

MEMORY.md is the map

Doesn't duplicate content. Only points to where each thing is. Always loaded.

OpenClaw · Course 2026 · Module 4 · Memory

Next module ·

Open a new session and ask about the decision · it should remember.
