MODULE 10 · MISSION CONTROL

Build Your AI COO

Why a Visual Dashboard?

You talk to the agent on Telegram. So why would you need a visual interface?

Telegram = interaction. Dashboard = vision

Chat is great for talking. But to see the state of the system at a glance? Visual dashboard wins.

What a Dashboard Solves

Quick Overview

How many crons ran today? Which ones failed? How many pending tasks? A glance answers everything.

· Metrics Tracking

MRR, active users, pieces of content produced, service uptime · all in one place.

· Visual Organization

Kanban of tasks, content pipeline, project status · easier to scan than text.

· Visual Alerts

Service down? Cost exploding? Deadline approaching? It becomes obvious with colors and badges.

Real Example: Amora Mission Control

SECTION

WHAT IT SHOWS

Tasks

Kanban: Backlog · In Progress · Done · Blocked

Memory

Recent insights, decisions, lessons learned

Crons

Status of each cron (last execution, next run, errors)

SECTION

WHAT IT SHOWS

Content HQ

229 packs, 773 pieces · visual production pipeline

Health

Gateway uptime, Telegram, skills, APIs

MODULE 10 · MISSION CONTROL

Build Your AI COO

4 Tool Options

From simplest to most customizable:

Option A: Google Sheets (Beginner)

- Pros
- Everyone knows how to use it
- Native charts
- Free
- Integrates with GOG skill (Google Calendar/Drive)
- Cons
- Not a real database
- Row limits (~10 million, but slow before that)
- No real-time
- Basic design
- Best for:

Quick prototyping, simple dashboards, those who want results in 30 minutes.

Option B: Notion (Intermediate)

- Pros
- Beautiful and familiar interface
- Relational databases
- Native mobile
- Easy sharing
- Skill available on ClawHub
- Cons
- API with rate limits (3 req/sec)
- Data in the cloud (not self-hosted)
- Cost if you need advanced features

·Best for:

Those who are already power users of Notion and want to integrate an agent with an existing workspace.

Module 10 · Mission Control

03

MODULE 10 · MISSION CONTROL

Build Your AI COO

Option C: NocoDB (Advanced Beginner)

- Pros
- Self-hosted (your data, your control)
- Notion-like interface
- Complete REST API
- Free and open-source
- Relationships between tables
- Docker Compose = quick setup
- Cons
- Requires basic Docker knowledge
- Less customizable than own code
- Smaller community than Notion

·Best for:

Those who want quick results with total data control. Recommended for most.

Option D: Custom (Next.js + Supabase)

- Pros
- Total control of UI/UX
- Real-time with WebSockets
- Free to host (Vercel + Supabase)
- Scalable and professional
- Learn modern tech stack
- Cons
- Requires full-stack dev knowledge
- Setup time: hours/days
- Ongoing maintenance

·Best for:

Devs who want something custom-made and are willing to invest time.

MODULE 10 · MISSION CONTROL

Build Your AI COO

Data Structure (Universal)

Regardless of the tool chosen, these are the essential "tables":

1. Tasks

id · unique identifier

title · task description

status · pending | in_progress | done | blocked

priority · low | medium | high | urgent

created_at · timestamp

due_date · deadline (optional)

assigned_to · agent or human

2. Memory Events

id · unique identifier

date · when it happened

category · decision | lesson | insight | observation

content · what was learned/decided

source · main | heartbeat | cron | sub-agent

3. Cron Jobs

id · unique identifier

name · cron name

schedule · cron expression or interval

last_run · last execution

next_run · next execution

status · active | paused | failed

last_result · success | error (+ message)

4. Health Checks

id · unique identifier

service · gateway | telegram | skill_X | api_Y

status · healthy | degraded | down

last_check · timestamp

uptime_% · availability (last 7 days)

5. Agent Stats (Metrics)

id · unique identifier

date · day

messages_sent · count

skills_used · list of triggered skills

errors · error count

model_tokens_used · total tokens

uptime_hours · active hours

MODULE 10 · MISSION CONTROL

Build Your AI COO

Connecting the Agent to the Panel

After choosing the tool and creating the tables, the agent needs functions to write data.

Essential Functions

Necessary Crons

Isolated crons that automatically update the panel:

..IMPORTANT: Use sessionTarget: isolated

// Example: helper functions for the agent

dashboard_log_task(title, priority)

// Creates task on the panel

dashboard_update_task(id, status)

// Marks as done/blocked

dashboard_log_memory(content, category)

// Saves important insight

dashboard_update_health(service, status)

// Updates service status

dashboard_get_stats()

// Returns summary of the day

JAVASCRIPT

stats-collector (every 1h)

Collects metrics (uptime, errors, skills used) and writes to the panel

1

health-monitor (every 15min)

Tests if gateway/telegram/skills are responding and updates health table

2

task-reminder (every 4h)

Checks tasks with due_date approaching and notifies on Telegram

3

Crons in the main session (systemEvent) DO NOT run. Use isolated + agentTurn + announce.

MODULE 10 · MISSION CONTROL

Build Your AI COO

Customize by Profile

What you show on the dashboard depends on your job:

· Founder

MRR, ARR, churn, CAC, LTV

Sales pipeline (leads · prospects · customers)

OKRs of the week/month

Runway (months of cash remaining)

... Dev

Recent deploys (success/failure)

Critical errors (via Sentry/Logtail)

Pending PRs for review

Service uptime (99.9% SLA?)

Test coverage

· Creator

Content published this week

Performance (views, engagement, CTR)

Production pipeline (ideas · script · recording · editing · published)

Ready content stock (buffer)

Productivity

Today's meetings

Tasks completed vs pending (burn-down chart)

Tracked habits (meditation, exercise, deep work)

Time in deep work vs shallow work

·Tip

Don't try to track EVERYTHING. Choose 5-10 metrics that really matter. Less is more.

07

MODULE 10 · MISSION CONTROL

Build Your AI COO

· Module 10 Checkpoint

Chosen tool (Sheets/Notion/NocoDB/Custom)

Created data structure (Tasks, Memory, Crons, Health, Stats)

Helper functions for the agent configured

Scheduled update crons (stats, health, reminders)

Custom widgets for your profile

First test: agent logged task and it appeared on the panel

· Prompt for the Agent

Paste this prompt into your OpenClaw chat after completing the module:

I just watched Module 10 on Mission Control. I need a visual dashboard to manage you and see the system status at a glance. Help me choose and configure the right tool: 1. Questions to get to know me: - What is my technical level? (beginner/intermediate/advanced) - Do I already use a tool? (Notion, Sheets, etc.) - Do I prefer something fast or something perfect? - Will I manage only you or a team of agents? 2. Based on my answers, recommend: - Which tool (Sheets/Notion/NocoDB/Custom) - Why this choice makes sense to me - Pros and cons specific to my case 3. Complete setup: - Guide me step by step in the configuration - Create the necessary tables (Tasks, Memory, Crons, Health, Stats) - Configure helper functions - Create update crons - Personalize the widgets for my profile (founder/dev/creator/productivity) 4. First test: - Log a test task - Show it appearing on the panel - Mark as "done" via you - Confirm the update 5. Document: - Create docs/mission-control-setup.md with everything we configured - Credentials in 1Password (never hardcoded) - How to access the panel Let's build my Mission Control?

.
